SUCCESS STORIES

▶More Success Story

The Albania government utilizes NUUO to enhance election¡¦s credibility
NUUO, together with AXIS and Mobotix IP cameras, create a reliable and stable surveillance system

Organization :
Albania Interior Ministry

Location :
Albania

Industry segment :
Government

Solution :
NUUO NVR(IP+)

Recording the real-time situation of 70 locations, 445 IP cameras
In June 2009, the Albanian government held a political election. Prior to the election, a surveillance system had been installed by system integrator--SHINE with the important mission of achieving public credibility and preventing election irregularities.

There are 70 voting stations in Albania, and the surveillance system needed to monitor and record the process of the ballot casting, counting and announcing. To avoid any possible dispute in this election, the most important consideration for the government was the stability of the surveillance system when these inter-regional 70 locations with 445 IP cameras operated and processed huge number of video signals at the same time during the election.

NUUO open platform links AXIS and Mobotix Megapixel IP cameras and brings them into full play
There were 445 CH of IP cameras installed in this system, including AXIS and Mobotix IP cameras with two different surveillance targets. AXIS 207MW Megapixel IP cameras were installed near the vote counting tables to record the vote counting process as well as the later announcement of the results. At the same time, Mobotix Q24 IP dome cameras were installed in the center of the votation room roof for general surveillance.

NUUO Live View and Remote Live View can control the system by limits of authority, and it can choose among various stream profiles to meet different needs. For vote result announcing, the stream must have high resolution to record the content on the ballots, but for general monitoring, the manager can modify the frame rate to the most appropriate level, thus using resources in the most efficient way.

More than security; a smart surveillance system minimizes cost and risk
NUUO enables 128 CH streams of remote live view at one time, offering clear and stable video quality, and it helped the central government to monitor all situations in the election office. The voting sites were connected by a VPN (Virtual Private Network) to the Interior Ministry. During the election, the officers observed feeds from all the sites, and were able to monitor all facets of the election as well as react when an adverse event occurred. In addition, in the case of any irregularities, the event would be recorded, allowing the government to deal confidently with any dispute or controversy.

A political election needs to avoid all manner of controversy and dispute and all processes need be publicly recorded and disclosed. NUUO offers software that enhances credibility and stability and helps the government to hold fair, safe, secure, and honest elections.
